# LightVideo

Video Processing and Analysis Software

for Enterprise Voice-Data-Video Convergence

LightVideo is a software application for corporate enterprise IP communications infrastructure designed to add value to standard video streaming and video surveillance systems through sophisticated analysis and presentable historical data.

LightVideo has components to analyze live video streams to generate presentable statistical data (utilizing pattern recognition, such as face recognition). LightVideo links to a powerful and customizable reporting engine (e.g. View through LightPage) and has an open architecture interface to integrate to third-party multi-media communications packages (e.g. video conferencing).

Components of LightVideo may be located throughout the enterprise, where streaming video source is available.

For example, LightVideo may be used as a non-intrusive employee/visitor tracking and work space utilization tool or provide location utilization metrics and public areas accessibility reports.

LightVideo may be utilized independently or used together with other LightSuite™ software modules as an integration framework for inter-connecting multiple business systems by different manufacturers.
